(a) Information regimes: the residual waits the router knows when it decides at intersection 1
intersection 1
intersection 2
intersection 3
intersection 4
vehicle
static: expected delays only
local phase: the light ahead
horizon $k = 2$: two countdowns
full timing: the whole plan
(b) The coupling of the accuracy bound: a red phase resynchronizes the planned and realized timelines
both arrive in green and pass
realized, crossing 1
planned, crossing 1
both pass on arrival:
gap unchanged
both arrive in red
wait to the onsets
realized, crossing 2
planned, crossing 2
both wait for the onsets:
gap resets to at most σ
$\leq \sigma$
time
